調查發現癌症病患經過化療後，最常見的三種副作用

- ✓ 疲憊(81%)。
- ✓ 嘔心嘔吐(71%)。
- ✓ 落髮問題(60%)。

疲憊、嘔心嘔吐、落髮
是三種常見的化療副作用

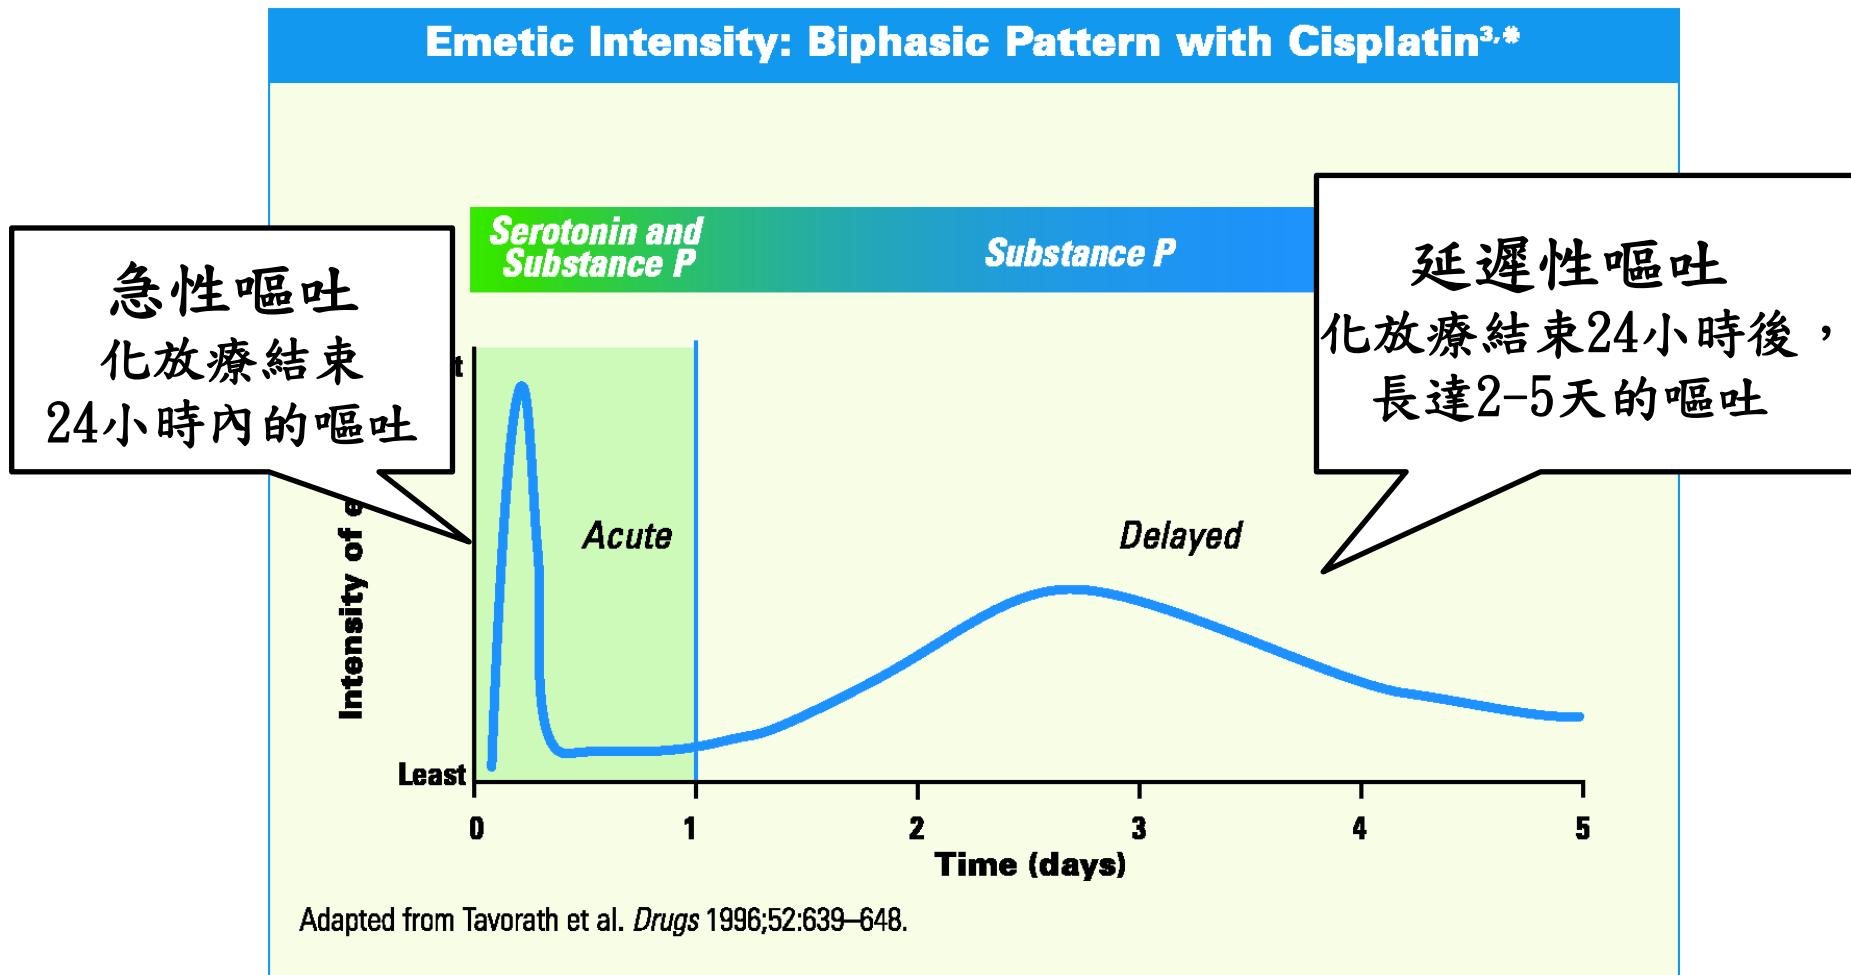

化療引起的嘔吐機轉

化學治療引起噁心嘔吐之類型及定義

- **急性噁心嘔吐 (Acute)**
 - 使用化學治療藥物後，24小時內
- **延遲性噁心嘔吐 (Delayed)**
 - 使用化學治療藥物後，超過24小時
 - 可能會持續至120小時(Day 5)
- **預期性噁心嘔吐 (Anticipatory)**
 - 使用化學治療藥物開始前數天至數小時發生
- **突發性噁心嘔吐 (Breakthrough)**
 - 已使用預防性處置，或止吐藥物，仍發生

急性及延遲性嘔吐 作用時間不同

Risk factors for CINV

Patient specific	Chemotherapy specific
Female	Emetogenic potential of a chemotherapeutic agent
History of morning sickness	Coadministration with other chemotherapeutic agents
Age <50 years	Dosage of chemotherapeutic agents
History of low alcohol intake (<1.5 oz/day)	Rate of intravenous (I.V.) infusion time
History of prior CINV	Repeated cycles of chemotherapy
History of nausea/vomiting during pregnancy	
Preexisting anxiety and nausea

化療藥物致吐性風險分級

單一化學治療藥物致吐風險分為四級

高致吐性	>90%
中致吐性	30%-90%
低致吐性	10%-30%
輕微致吐性	<10%

合併化學治療藥物致吐風險分級

其藥物組合中，致吐風險分級最高者為其整體組合之分級。

Commonly Used Highly and Moderately Emetogenic Chemotherapy Regimens

Cancer Type	Regimen
Breast	AC, TAC, TC, CMF, TCH
Lung	Carbo-Tax, Cis-Tax, cisplatin with vinorelbine, cisplatin with gemcitabine, cisplatin with pemetrexed
Head and neck	Cisplatin-based or carboplatin-based regimens
Hodgkin lymphoma	ABVD, CHOP with or without rituximab, CVP
Colorectal	FOLFOX, FOLFIRI, CapeOX, irinotecan
Ovarian	Carbo-Tax, IP cisplatin, cisplatin

ABVD—doxorubicin + bleomycin + vinblastine + dacarbazine; AC—doxorubicin + cyclophosphamide; CapeOX—oxaliplatin + capecitabine; Carbo-Tax—carboplatin + paclitaxel; CHOP—cyclophosphamide + doxorubicin + vincristine + prednisone; Cis-Tax—cisplatin + paclitaxel; CMF—cyclophosphamide + methotrexate + fluorouracil; CVP—cyclophosphamide + vincristine + prednisone; FOLFIRI—irinotecan + leucovorin + 5-fluorouracil; FOLFOX—oxaliplatin + leucovorin + 5-fluorouracil; IP—intraperitoneal; TAC—docetaxel + doxorubicin + cyclophosphamide; TC—docetaxel + cyclophosphamide; TCH—doxorubicin + carboplatin + trastuzumab

止吐藥物使用原則

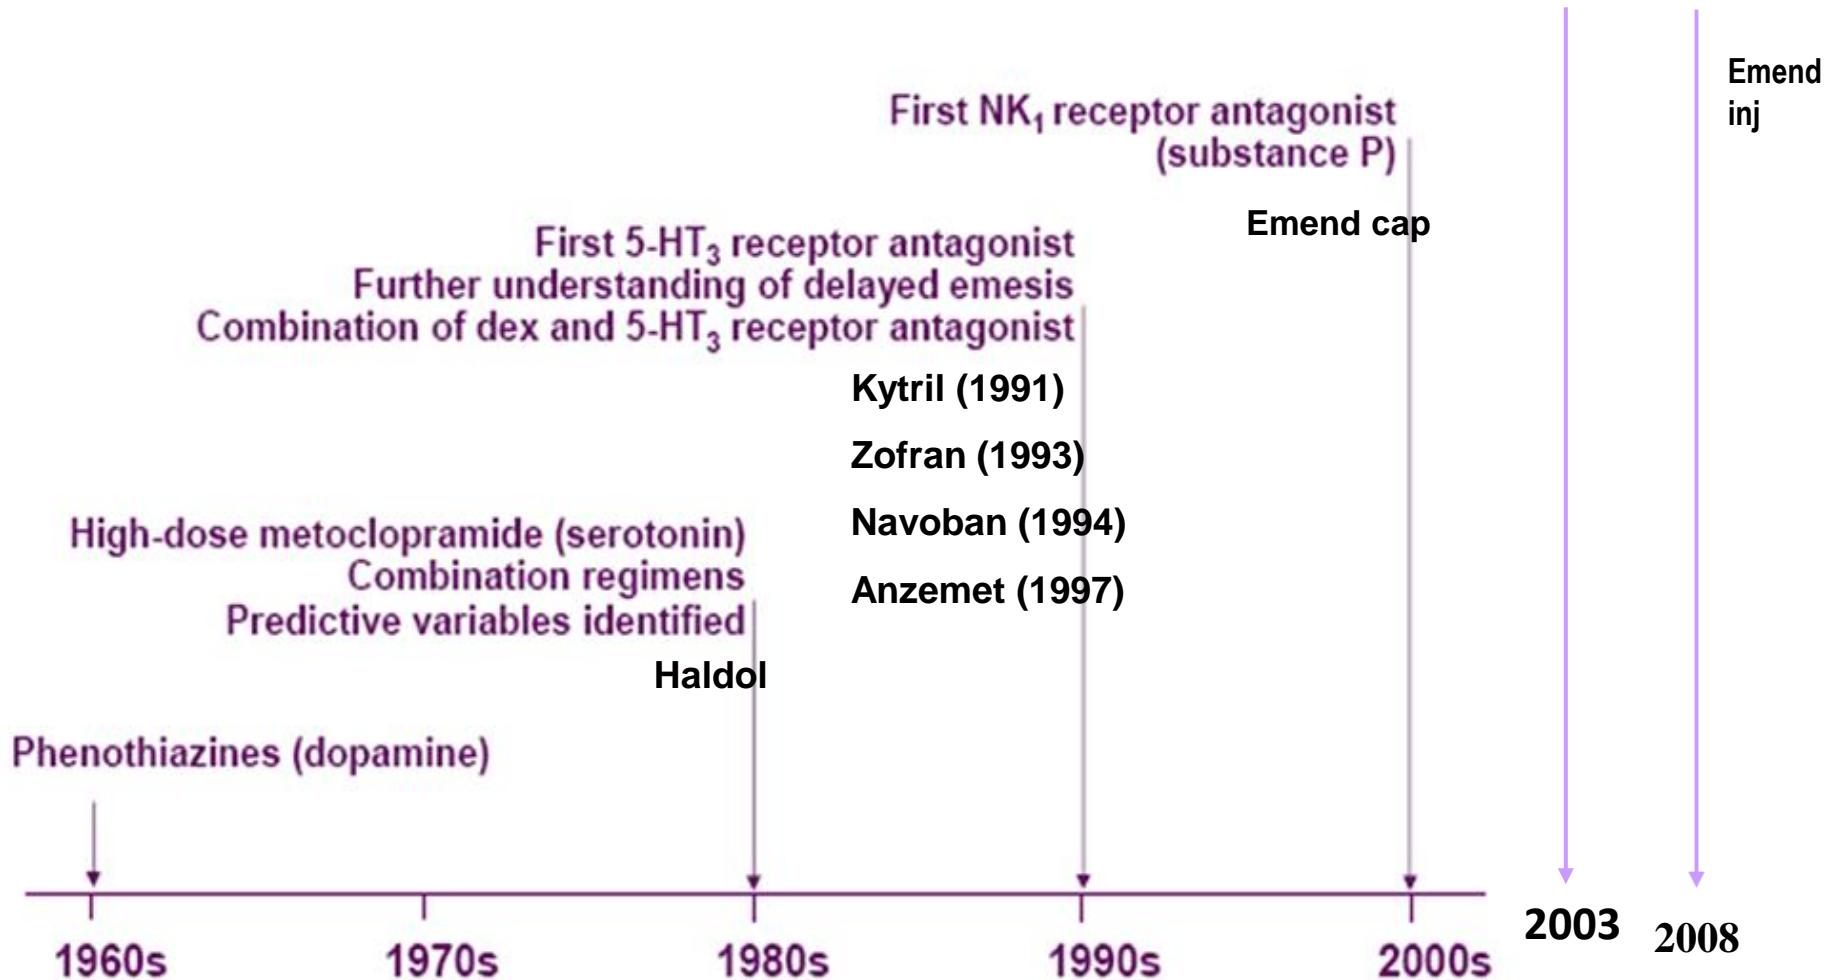

1. 以預防噁心嘔吐為目標
2. 病人開始接受化學治療藥物前即給予止吐藥物，以達到最大止吐效果
3. 止吐藥物的選擇須考量化學治療藥物致吐風險、病人之前使用止吐藥物的反應、病人個人因子、個別止吐藥物之毒性
4. 口服與靜脈給藥之止吐效果相當（口服可以為第一選擇）
5. 止吐藥物的使用期間必須考慮化學治療藥物引起噁心嘔吐作用期間
6. 病人接受高度致吐性化學治療藥物，考慮其致吐風險至少為3天；中度致吐性藥物，致吐性風險至少為2天；於整個風險期間，必須實施嘔吐預防

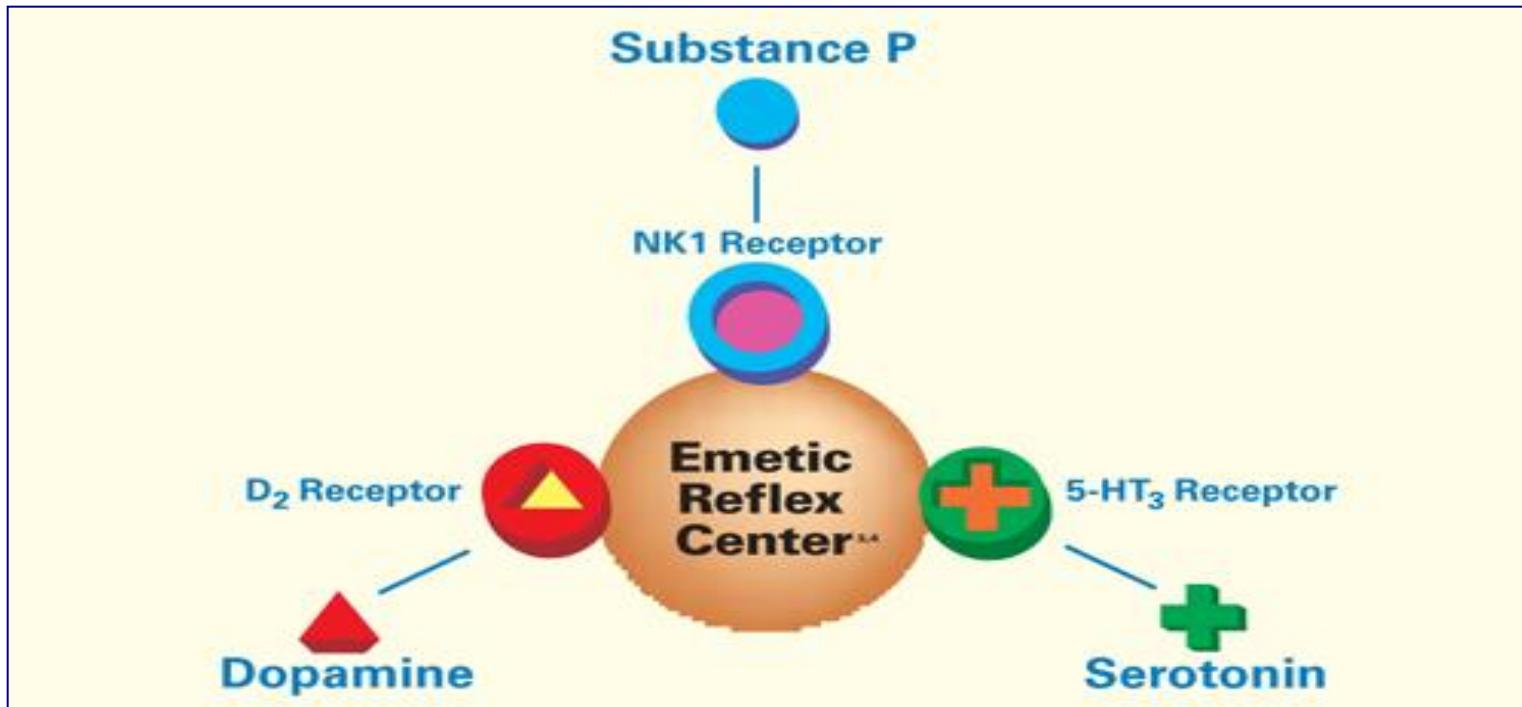

止吐劑類別

- Corticosteroids
- Dopamine antagonists
- Serotonin (5-HT3) antagonists
- NK-1 receptor antagonists
- Cannabinoids (ex : dronabinol 、 nabilone 、 levonantradol)
- Others

止吐劑的發展

The second generation
of 5-HT₃ RA, Aloxi

Histamine (H_1) receptors play a role in nausea and vomiting caused by the vestibular system (ie, motion sickness) but not CINV¹; no role for histamine (H_2) receptors in CINV²

Dopamine is no longer thought to be a key neurotransmitter responsible for CINV, now that the roles of serotonin and substance P are better understood²

1. Diemunsch P, Grélot L. Drugs. 2000;60:533–546.

2. Berger AM et al. In: Cancer: Principles & Practice of Oncology. Lippincott Williams & Wilkins; 2001:2869–2880.

常用現有止吐藥物的作用機轉

藥物分類	Drugs	作用機轉
5HT ₃ antagonist	Ondansetron, Granisetron, Tropisetron, Dolasetron Palonosetron	CTZ & peripheral 5HT ₃
NK-1 antagonist	Aprepitant(Emend)	CTZ substance-P
Corticosteroid	Dexamethasone	Prostaglandin
BZD	Lorazepam, Diazepam	Sedative & anxiolytic
Antihistamines	Diphehydramine	Vestibular nucleus
Dopamine & 5HT3 receptor	Metoclopramide	Dopamine antagonist

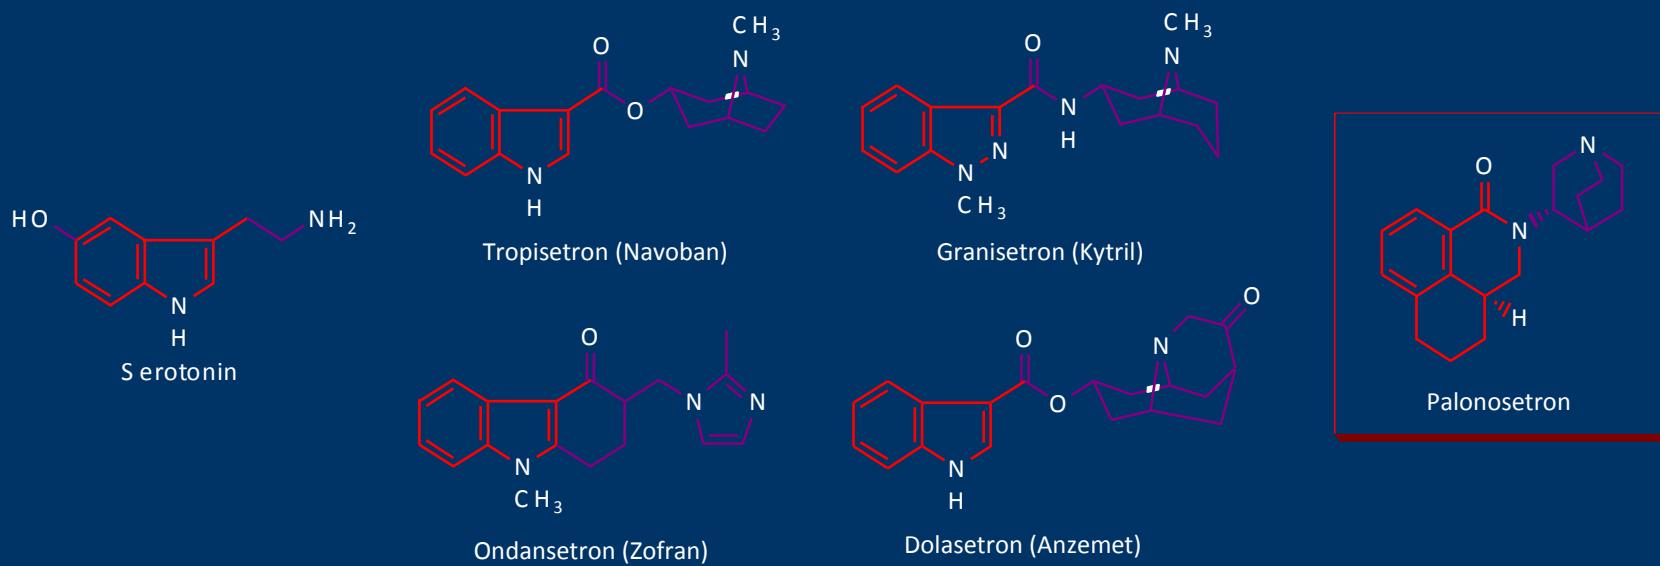

5-HT₃受體拮抗劑

- 所有的5-HT₃受體拮抗劑皆可以有效地控制化學治療藥物引起之急性嘔吐
- 併用Dexamethasone可增加含有5-HT₃受體拮抗劑的治療藥物組合之止吐效用
- 靜脈注射Palonosetron可以有效地預防中致吐性化學藥物所引起之急性與延遲性嘔吐
- 每日單次之劑量為佳
- 等效治療劑量下，口服與靜脈給藥之止吐療效與安全性相當
- 副作用：constipation, diarrhea, dry mouth, and fatigue.

5-HT₃ RA : chemical structure

第一代 5-HT₃ RA

第二代

First generation 5-HT₃ antagonists resemble serotonin;
palonosetron is structurally distinct

Mechanism of Action Conclusions

All 5-HT3 RAs structures resemble serotonin...

	PALO	OND	GRAN	TROP	RAMO
Potency (NHI cost 元)	0.25mg/vial (1107)	4mg/8mg/vial; 8mg/tab (219/296;225)	1mg/3 mg/vial; 1mg/tab (450/959;259)	5mg/vial; 5mg/tab (425;428)	0.3 mg/vial (525)
Half Life (hrs)	40	4	9	8	5.8~9
Binding Affinity	10.45	8.39	8.91	8.81	10.23
Allosteric binding & Positive Cooperativity	YES	NO	NO	NO	NO
Inhibition of Receptor Function	Long Lasting	Short Lasting	Short Lasting	Short Lasting	Short Lasting
Receptor Internalization	YES	NO	NO	NO	NO
Inhibition of 5-HT3 & NK1 receptor cross-talk	YES	NO	NO	NO	NO

皮質類固醇 (Corticosteroids)

- 單一藥物適用於低致吐性化學治療藥物所引起之嘔吐
- Dexamethasone併用5-HT₃受體拮抗劑與aprepitant，對於高度或中度致吐性化學治療藥物所引起之嘔吐效果特別有價值
- 等效治療劑量下，皮質類固醇之止吐效果與安全性相當
- 已含皮質類固醇的化學治療藥物組合，避免另加入dexamethasone作為止吐之用
- 併用aprepitant時，口服皮質類固醇劑量降為原劑量之50%，而靜脈注射劑量則下降為75%

NK-1 receptor antagonist

- Aprepitant(PO); Fosaprepitant (IV),
 - PO : 125 mg on Day 1 of chemotherapy, then 80 mg daily on days 2 and 3,
 - IV : 150 mg on Day 1 only as an infusion over 20 to 30 minutes initiated approximately 30 minutes before chemotherapy.
- **combined with a regimen of dexamethasone (3 ~ 4 days) and a 5HT3 antagonist(only Day 1)**
- Common adverse effects: hiccups (4.6%), asthenia/fatigue (2.9%), increased ALT (2.8%), constipation (2.2%), headache (2.2%), and anorexia (2.0%)..

	Geometric mean	
	Aprepitant (125 mg)	Fosaprepitant (115 mg)
AUC _{0 - ∞} , ng·h/ml	27,759	29,611
C _{max} , ng/ml	1,354	3,095
C ₂₄ , ng/ml	494	504
t _{max} , h	4	0.25
t _{1/2} , h	14	13.6

Precaution (1)

- Aprepitant, is a moderate cytochrome P450 isoenzyme 3A4 (CYP3A4) inhibitor. Because fosaprepitant is rapidly converted to aprepitant, neither drug should be used concurrently with pimozide, terfenadine, astemizole, or cisapride.
 - Inhibition of CYP3A4 by aprepitant could result in elevated plasma concentrations of these drugs, potentially causing serious or life-threatening reactions.
- In clinical trials, EMEND increased the AUC of dexamethasone(CYP3A4 substrate), by 2.2-fold on Days 1 and 5;
 - the dexamethasone dose should be reduced by approximately 50% when coadministered with EMEND.

Precaution (2)

- Aprepitant with warfarin may result in a clinically significant decrease in international normalized ratio (INR) of prothrombin time.
 - In patients on chronic warfarin therapy, the INR should be closely monitored in the 2-week period, particularly at 7 to 10 days, following initiation of the 3-day regimen of EMEND with each chemotherapy cycle.
- The efficacy of hormonal contraceptives may be reduced during coadministration with Aprepitant and for 28 days after the last dose of Aprepitant.

Dopamine受體拮抗劑

- 適用於對 5-HT_3 受體拮抗劑、NK-1受體拮抗劑、dexamethasone等止吐藥無法耐受或無療效的病人
- Phenothiazine (如：prochlorperazine, thiethylperazine)；Dopamine antagonist，(如：metoclopramide)；butyrophenones (如：haloperidol和droperidol)。
- 副作用：muscle spasms and restlessness.

Benzodiazepine

- Lorazepam在致吐藥物組合中為輔助性角色，不建議單獨使用
- Lorazepam可以協助預防與治療預期性嘔吐

2009 台灣癌症化學治療引起
之噁心嘔吐處理規範

急性嘔吐的預防

藥物致吐性分級	於第一天(day 1)使用化學治療藥物前
高致吐性 併用 anthracycline 與 cyclophophamide	<u>5-HT₃受體拮抗劑併用 dexamethasone</u> <u>與 aprepitant</u>
中致吐性	<u>5-HT₃受體拮抗劑併用 dexamethasone</u>
低致吐性	<u>使用 dexamethasone</u>
輕微致吐性	無須常規性使用止吐用藥

延遲性嘔吐的預防

藥物致吐性分級	使用方法
高致吐性	<u>Corticosteroids (於第二至第四天使用)</u> <u>併用 aprepitant (於第二至第三天使用)</u>
併用 anthracycline 與 cyclophosphamide	<u>Corticosteroids (於第二至第三天使用)</u> <u>併用 aprepitant (於第二至第三天使用)</u>
中致吐性	<u>使用 Corticosteroids 或 5-HT₃受體拮抗劑(於第二至第三天使用)</u>
低或輕微致吐性	無須常規性使用止吐用藥

預期性嘔吐的預防

- 最佳預防方法為儘力控制病人的急性與延遲性嘔吐
- 預期性嘔吐應用心理性方式處理
- 考慮benzodiazepines為心理性方式之外加或替代治療

突發性嘔吐的治療-1

- 突發性嘔吐之治療原則為加上不同作用機轉之止吐藥物；各類止吐藥物對於突發性嘔吐之控制效果差別不大
- 應考量以固定時間且固定間隔方式給予止吐藥物，不建議以PRN方式處理
- 以靜脈或直腸給藥較口服給藥適當，因為病人可能正處在嘔吐狀態
- 確認病人無脫水現象，並考量其電解質之平衡

突發性嘔吐的治療-2

- 於下一次化學治療療程前，重新評估病人狀況，且需注意無關於本次化學治療引起突發性嘔吐之因素，其因素如下：
 - (1) 腫瘤之腦部轉移
 - (2) 體內電解質不平衡
 - (3) 腫瘤之腸胃道
 - (4) 其他疾病

化療不必吐
止吐藥緩解噁心感
